According to the designing thinking literature [4], a data viz contains the following three groups of 'ingredients:'

- User needs/benefits, i.e., the information a user wants to achieve
- Design, i.e., the set of choices regarding the visual forms, color, density, redundancy, and so on that characterize a data viz
- Technology, i.e., the knowledge, tools, and data underlying the data viz

How does the data viz process look like?

Session #2
Wrap Up

References

The design thinking literature [4] suggests that the user needs/benefits component should be the starting point of the data viz process. The intuition is that data viz that addresses nobody's needs is useless!

Instead, there is substantial flexibility when it comes to fix the design and technology components. Ultimately, the order depends on contingent factors and the designer's background, skills, and preferences.

Per Tufte's work [3], excellence in statistical graphs consists of complex *“ideas communicated with clarity, precision, and efficiency.”*

Graphical displays pursuing clarity, precision, and efficiency *“give to the viewer the greatest number of ideas in the shortest time with the least ink in the smallest space.”*

Tufte points out graphical displays should

- Show the data
- Induce the viewer to think about the substance rather than about the methodology, graphical design, the technology of graphic production, or something else
- Avoid distorting what the data have to say
- Present many number in a small space
- Make large datasets coherent
- Encourage the eye to compare different pieces of data
- Reveal the data at several levels of detail, from a broad overview to the fine structure
- Serve a reasonably clear purpose: description, exploration, tabulation, or decoration
- Be closely intergrated with the statistical and verbal description of a data set

Show the Data!

What, how,
and why of
data viz

S. Santoni

Here is a classic example on the importance of showing the data, the case of Anscombe's quartet [2].

I		II		III		IV	
X	Y	X	Y	X	Y	X	Y
10.0	8.04	10.0	9.14	10.0	7.46	8.0	6.58
8.0	6.95	8.0	8.14	8.0	6.77	8.0	5.76
13.0	7.58	13.0	8.74	13.0	12.74	8.0	7.71
9.0	8.81	9.0	8.77	9.0	7.11	8.0	8.84
11.0	8.33	11.0	9.26	11.0	7.81	8.0	8.47
14.0	9.96	14.0	8.10	14.0	8.84	8.0	7.04
6.0	7.24	6.0	6.13	6.0	6.08	8.0	5.25
4.0	4.26	4.0	3.10	4.0	5.39	19.0	12.50
12.0	10.84	12.0	9.13	12.0	8.15	8.0	5.56
7.0	4.82	7.0	7.26	7.0	6.42	8.0	7.91
5.0	5.68	5.0	4.74	5.0	5.73	8.0	6.89

N = 11
mean of X's = 9.0
mean of Y's = 7.5
equation of regression line: $Y = 3 + 0.5X$
standard error of estimate of slope ≈ 0.118
 $t = 4.24$
sum of squares $X - \bar{X} = 110.0$
regression sum of squares = 27.50
residual sum of squares of Y = 13.75
correlation coefficient = .82
 $r^2 = .67$
